

Investor Update

July 2026 | Prepared for Anna

\$5,995.24 → \$9,750.93
+62.6% over two trading days

Here is where we stand after the first two full days of trading the new momentum approach. Every position is bought and sold the same morning. Nothing is held overnight. I put essentially the whole account into each trade, sell it, and roll the proceeds into the next one, so the gains build on each other.

	Started	Ended	Gain	Return	Trades
Monday July 20	\$5,995.24	\$7,142.41	\$1,147.17	+19.13%	4 of 4 profitable
Tuesday July 21	\$7,198.10	\$9,750.93	\$2,552.83	+35.47%	5 of 5 profitable
Combined	\$5,995.24	\$9,750.93	\$3,755.69	+62.64%	9 of 9 profitable

How We Get There

Every trade came off a morning screen I built that watches roughly three thousand stocks at once and flags the ones moving unusually fast on unusually heavy trading. None of these nine were companies I was following beforehand. They surfaced, I looked at them, and I acted. The clearest lesson so far is that the fastest trades pay the best. My shortest positions, all under five minutes, made the most money.

A word of caution I want on the record: nine wins in a row will not continue forever, and I am not counting on it. What I believe is repeatable is the structure. Get in with a limit, take the gain, get out, and never hold overnight. That discipline is what keeps a bad day small.

The Cost of Doing Business

July 2026 | Operating expenses

The system runs on two paid data services. Here is what they cost and why we pay for them.

Service	What it does	Monthly	Per Year
FMP Ultimate	The data backbone. Scans the whole market and feeds every price on the board.	\$64.92	\$779.00
Polygon / Massive	New real time feed. Removes the data delay on fast movers where our biggest trades live.	\$199.00	\$2,388.00
	Total	\$263.92	\$3,167.00

What We Are Cutting

We are canceling the Unusual Whales subscription. It gave us options flow and dark pool data that we used for the biotech drug approval strategy, and we are not running that daily right now. If we return to it after the slow season in August and September, we can turn it back on in minutes. There is no reason to pay for it while it sits idle, so it is not in the numbers above.

The Part Worth Sitting With

Two days of trading gained \$3,755.69. A full year of both data tools costs \$3,167.00.

In other words, the first two days more than paid for an entire year of the tools that make the trading possible. I want to be careful not to read too much into two good days, but the shape of the economics is clear. The running cost is small next to what a single strong morning produces, and the new real time feed is the one upgrade most likely to add to that edge by getting us into the fast movers a beat sooner.

The FMP figure is the current published annual rate for the Ultimate plan and should be confirmed against our actual billed amount. Polygon is billed monthly and can be paused at any time. Performance figures come from my own trade records and are before commissions, fees, and taxes. Starting capital for each day is that day's first position. Past results are not a guide to future returns. This summary is for information only and is not investment advice.
