EXECUTIVE SUMMARY

The Opportunity

ODIN is a machine-learning scoring engine trained on 2,200+ historical FDA events. It produces calibrated approval probabilities for PDUFA catalysts (AUC 0.9003) and phase readout success predictions via GUNGNIR (AUC 0.7529).

The strategy exploits pre-event momentum ("runups") that occur T-60 to T-7 before catalyst dates. We exit before the binary event, capturing the predictable drift while avoiding coin-flip risk.

From 811 2026 biotech catalysts, we scored 797, identified 445 tradeable opportunities, and built a 63-trade leapfrog compounding strategy targeting +43.4% annual return on \$140,000 starting capital.

Key Metrics

Starting Capital	\$140,000
Projected Final Capital	\$200,696
Expected Return	+43.4%
Number of Trades	63
TIER 1 Trades	29 (highest conviction)
Sweet Spot (T1×MID)	29 catalysts @ 72.7% hit
Win Rate (empirical)	51–73% by tier/cap
Avg Holding Period	7–60 days
Max Concurrent	6 positions

HOW THE SCORING ENGINES WORK

ODIN vNEXT v5

FDA Approval Probability

Holdout AUC: 0.9003

25 features, L2 Ridge logistic regression

Trained on 2,203 PDUFA events (2002-2024)

Key drivers: sponsor experience, BTD, priority review, surrogate endpoints, prior CRL history

Scores PDUFA dates, NDA/BLA filings

Tier System:

T1 (≥ 0.85): LONG | T2 (≥ 0.65): CAUTIOUS

T3 (≥ 0.40): MONITOR | T4 (< 0.40): NO TRADE

GUNGNIR v27

Phase Readout Success Prediction

Holdout AUC: 0.7529 (zero leakage)

33 features, L2 Ridge logistic regression

Pre-readout features only (no outcome data)

Key drivers: designation count, prior positive phase, surrogate endpoints, ORR $\times$ oncology

Scores Phase 1/2/3 readouts via NLP

Tier System:

T1 (≥ 0.70): 92.4% success rate

T2 (0.55-0.70): 85.5% | T3 (0.40-0.55): 76.8%

THE RUNUP STRATEGY

Buy the anticipation, sell the news. The runup IS the trade.

Cap Size	Tier	Entry	Exit	Avg Return	Sharpe	Hit Rate
MID	TIER 1	T-14	T-7	+7.95%	0.657	72.7%
LARGE	TIER 1	T-30	T-5	+6.50%	0.359	62.9%
MEGA	TIER 1	T-60	T-7	+2.78%	0.208	57.3%
SMALL	TIER 2	T-30	T-5	+6.39%	0.212	54.6%
MID	TIER 2	T-14	T-5	+3.15%	0.340	64.0%
LARGE	TIER 3	T-7	T-1	+1.93%	0.402	63.9%

DEAD MONEY ZONE: T-7 to T-1 has negative median returns (-0.22%). Never hold through the binary event. The runup ends at T-7 for most tier/cap combinations. T-1 clean means zero PDUFA exposure.

SCORING RESULTS: 797 CATALYSTS

Breakdown

ODIN (PDUFA/NDA/BLA)	144
GUNGNIR (Phase 1-3)	653
Total Scored	797
Tradeable (T1-T3)	445
Excluded (T4)	352
TIER 1 (≥ 0.85 / ≥ 0.70)	176
TIER 2 (≥ 0.65 / ≥ 0.55)	104
TIER 3 (≥ 0.40 / ≥ 0.40)	165
Sweet Spot (T1×MID)	29

RISK MANAGEMENT & DISCLAIMER

Risk Controls

TIER 4 = NO TRADE.

No exceptions regardless of revenue impact or narrative.

Maximum 6 concurrent positions to limit correlation risk.

Maximum 3 nano/small-cap concurrent to limit liquidity risk.

Exit at window end (T-7 or T-5). No exceptions.

Never hold through the binary PDUFA/readout event.

Position sizing tied to Sharpe ratio and tier.

Dead money zone (T-7 to T-1) empirically validated.

Important Disclosures

This presentation is for informational purposes only and does not constitute investment advice.

Past performance and backtested results do not guarantee future returns. All projected returns are based on historical empirical data and model estimates.

ODIN and GUNGNIR scores represent statistical probabilities, not certainties. Individual catalyst outcomes are binary and unpredictable.

Biotech stocks carry substantial risk including total loss of capital. Position sizing and diversification rules are designed to mitigate but not eliminate this risk.

The leapfrog compounding projection assumes all trades execute at empirical average returns, which will not occur in practice. Actual results will vary.
